A cDNA clone (T44092) codes for a human 7-transmembrane receptor (W07617) putatively identified as a G-protein thrombin receptor.

was discovered in a human infant brain cDNA library. G-protein thrombin-like receptor polynucleotides can be used to produce recombinant receptor in host cells (e.g. E. coli, COS-7, Sf9), to design probes for detecting diseases releated to receptor gene mutation, and in gene therapy to treat haemophilia or promote woun healing; antisense sequences can be used to treat inflammation, restenosis, angina, etc.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        8
DIA endoding v28 seven transmembrane receptor polypeptide - useful producing recombinant polypeptide and anti-v28 antibodies, and pri for producing recombinant polypeptide and anti-v28 antibodies, and pri screening assays for v28 agonists and antagonists

Example 10; Columns 85-88; 56pp; English.

CC The present novel sequence represents the human R12 genomic DNA isolated from a human genomic fetal liver DNA library. The invention claims for the full length v28 genomic DNA sequence (v18343) isolated from a human placenta genomic library. The v28 (W48722) and R12 proteins are seven placenta genomic library. The v28 (W48722) and R12 proteins are seven transduction. The invention also claims that cells transformed with CC transduction. The invention also claims that cells transformed with CC transduction. The invention also claims that cells transformed with CC transduction. The antibodies or in screening assays for V28 agonists or antagonists. The antibodies, agonists and antagonists could then be used to modulate V28 receptor-ligand binding, for e.g. in immunological and/or inflammatory events in vivo.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Isolated human platelet factor 4 super-family receptor polypeptide and corresp. antibodies and DNA - useful as diagnostic and screening agents, and for treating inflammation or prakar-mediated disorders
Claim 7: Fig 5: 78pp; English.
CThe IL-8 receptor CDNA sequence was isolated (see Q29505) and a corresp sub-fragment of the coding sequence was used as a probe to screen human cell line HL60 and human peripheral blood lymphocyte count libraries. Two new genp sequences were found that are clearly related to the IL-8 receptor. One of these was contained in clone Str.9 and is predicted to encode an amino acid sequence which is sequences, respectively. See also Q37107

2 PF4AR members were identified by probing lambda libraries fr
human monoclyte-like cell line HL-60 and human peripheral bloo
lymphocytes using a large fragment of IL-8 receptor DNA (full
sequence given in 080520). The nucleotide sequences of the 2
PF4ARS are given in 080521 and 080522 and their respective
amino acid sequences in K68812 and R68813.

Example 2; Columns 51-54; 62pp; English.
Antibodies directed against the interleukin-8 receptor B can be used to treat or prevent inflammation e.g. psorlasis, dermatitis, rheumatoid arthritis and particularly inflammatory bowel disease and chronic lung inflammation. When immobilised, these antibodies may be used to detect interleukin-8 receptor B expression in cells and tissues and for affinity purification of interleukin-8 receptor B from cells. This sequence is an additional chemokine superfamily receptor which was identified by probling lamda libraries of genomic DNA from a human monocyte-like cell line (L-60) and human peripheral blood lymphocytes using a large fragment of the interleukin-8 type
                                                                                                                                                                            P-PSDB; R92239.

CC This cDNA clone encodes a novel human G protein coupled receptor, cc termed pyx11 (see wg7942), that has selective affinity for Arp. A CC human cDNA placenta cDNA library was screened with a human p2v4 cc pnrobb. Of 9 clones obtained, 3 corresponding to a partial sequence cc encoding a new G protein coupled receptor displaying about 30% cc identity with other P2v receptors. This partial sequence was used cc as a probe to screen a human genomic DNA library. 4 overlapping cc genomes clones were isolated. Mapping and sequencing showed the new gene contained an intron at the 5' end of the coding region. Cc receptor, designated P2vil. The invention also provides vectors, cc transformed cells, anti-P2vil antibodies, nucleic acid probes, care used to block binding of P2vil to its ligand. Probes are used to block binding of P2vil to its ligand. Probes are used to block binding of P2vil to its ligand. Probes are used to mainals antibodies are used to decrease activity of p2vil, while specific antibodies are used to determine the effects of varying clevel, while antibodies are used to determine the effects of varying clevel, while antibodies are used to determine the effects of varying clevels of P2vil expression. These animals, and host cells, are contained with excessive or inadequate receptor activity, specifically neutropaenia, agranulocytosis, infections and cancer. Cc associated with excessive or inadequate receptor activity, sequence 2427 Bp; 464 A; 790 C; 774 G; 399 T;

School of Medicine, St Louis, Missouri) was screened with two 32P-labeled oligos corresp. to bp 190-249 and 742-801 of the bovine substance K receptor CDNA. In one of the clones isolated (C140) the hybridising region was localised to a 3.7 kb PstI fragment. This fragment was subcloned into pBluescript vector. The hybridising and adjacent regions were sequenced. The nt sequence and the deduced AA sequence are given in Q84557 & R69920 respectively. The published DNA sequence appears to have been printed with the last two lines in the wrong order. This has been corrected in this GeneSeq entry. Sequence 1477 BP; 341 A; 414 C; 320 G; 402 T;

Claim 1; Fig 10; 57pp; English.

A CDNA library from a mouse stomach was constructed in lambda gt10

A CDNA library from a mouse stomach was constructed in lambda gt10

and screened with a probe encompassing the C140 genomic clone (see Q84557). A single phage clone was isolated and cut with EcoRI. The insert was cloned in pBluescript and pSG5 and sequenced. The complete nt sequence and deduced AA sequence is given in Q8459 & R66992. 5' RACE resulted in the addition of only 27 bps to the 5' end. The 5' end of the apparent coding region differs from the 5' end of the CORT of genomic DNA; it is believed that the 5' end of the CORT of genomic DNA;

Molecular cloning and characterization of a novel orphan receptor
(P2P) expressed in human pancreas that shows high structural
homology to the P2U purinoceptor
FEBS Lett. 384 (3), 260-264 (1996)
